

PROFESSIONAL SUMMARY

Business Data Analytics graduate with hands-on experience in SQL, PostgreSQL, Power BI and DAX. Skilled in transforming raw data into analytical datasets, validating data quality, and building dashboards to translate business questions into actionable insights. Interested in using data analytics to support data-driven decision making and create business value.

TECHNICAL SKILLS

SQL & Databases: PostgreSQL, star schema (dim/fact), CTEs, window functions, data testing, query tuning

BI & Visualisation: Power BI (DAX, JSON themes, page navigation), advanced Excel (PivotTables, Power Query)

Programming & Analytics: Pandas, scikit-learn, SQLAlchemy; data profiling, cleaning, modelling

Banking Domain: Credit risk (Altman Z-score, DTI, credit grade), customer segmentation, transaction behaviour

EDUCATION

Bachelor of Business Data Analytics

2022-2026

International School, Vietnam National University · GPA: 3.53/4.0

- First Prize, University-Level Student Research Competition (2024) – Financial statement comparability and stock liquidity in Vietnam. Team of three; responsible for data collection and analysis.
- Faculty-level Research Project (2024) – Tobacco tax rates and consumer behaviour in Vietnam. Project Lead; led research design, data analysis, and report writing.

PROJECTS

Bank Transactions Analytics

[Github](#)

PostgreSQL · Python · Power BI · Git

- Built an end-to-end ELT pipeline (Excel → Python → PostgreSQL → Power BI) over 20,000 transactions from 8,025 customers across 29 months, with 100% row reconciliation between source and marts.
- Identified data-quality issues through profiling: four customer attributes were randomly assigned at row level, with 73% of customers showing conflicting values; removed three unreliable analysis tracks.
- Designed a star schema of 6 dimension tables and 1 fact table in SQL, with tests for uniqueness, referential integrity and reconciliation.
- Delivered a Power BI report answering 12 business questions across segmentation, transaction behaviour, fee revenue and time trends.

NovaBank – Credit Risk Analytics

[Github](#)

Power BI · DAX · Report design

- Cleaned and modelled a 32,574-loan portfolio (US, UK, Canada) in Python and SQL Server, using a two-layer design so SQL queries and the four-page Power BI dashboard read from one scored table.
- Quantified the exposure at risk 21.8% default rate, \$77M of \$312M principal, and isolated a segment holding 10.4% of loans but 29.4% of all defaults.
- Located a DTI breakpoint at 0.40 and a sharp risk cliff between grades C and D, and showed geography carried no signal, turning both into specific underwriting recommendations.

Financial Distress Early-Warning Model

[Github](#)

Python · scikit-learn · Graph Neural Networks (GCN / GraphSAGE / GAT)

- Built a binary early-warning classifier for financial distress across Nasdaq-100 firms from 45 financial indicators over 2017–2022, labelled by Altman Z-score (below 1.8 = high risk).
- Prevented look-ahead bias with a strict time-based split (train 2017–2020, validate 2021, test 2022) and handled severe class imbalance by tuning the decision threshold along the precision-recall curve instead of defaulting to 0.5.
- Improved F1 from 69.2% to 75.9% through causal feature weighting, outperforming the strongest classical baseline (74.1%).

CERTIFICATIONS & ACTIVITIES

- Google Data Analytics & Google Business Intelligence Specializations – Coursera, 2024
- SQL Intermediate – Xóm Data, 2026
- Google AI Professional Certificate – Coursera, 2026
- Aptis ESOL – B2 (CEFR), British Council
